

# Novel Efficient Solid Storage for Hydrogen

## The NESSHY Integrated Project: An Overview

**Thanos Stubos**

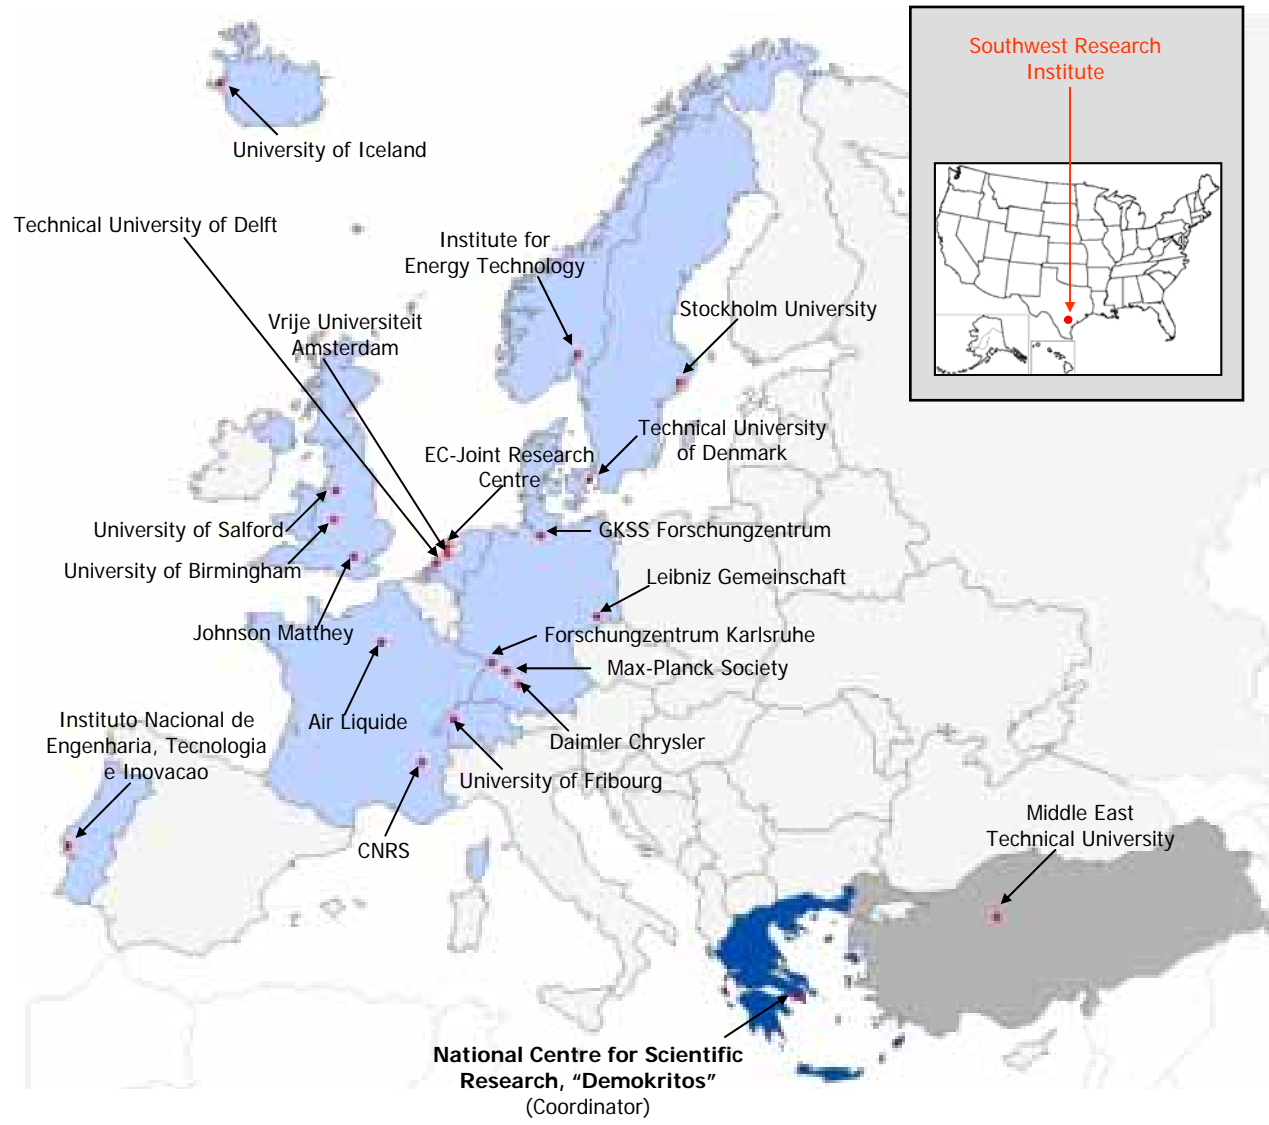

National Center of Scientific Research « Demokritos »  
Athens – Greece

# NESSHY General facts

- Co-ordinator: NCSR Demokritos (Greece)
- Duration: 1.1.2006 – 31.12.2010 (5 years)
  - Budget: M€ 11.3
  - EC contr.: M€ 7.5
- 22 partners from 12 European countries and USA (1 OEM, 19 research institutes, 2 industrial companies)

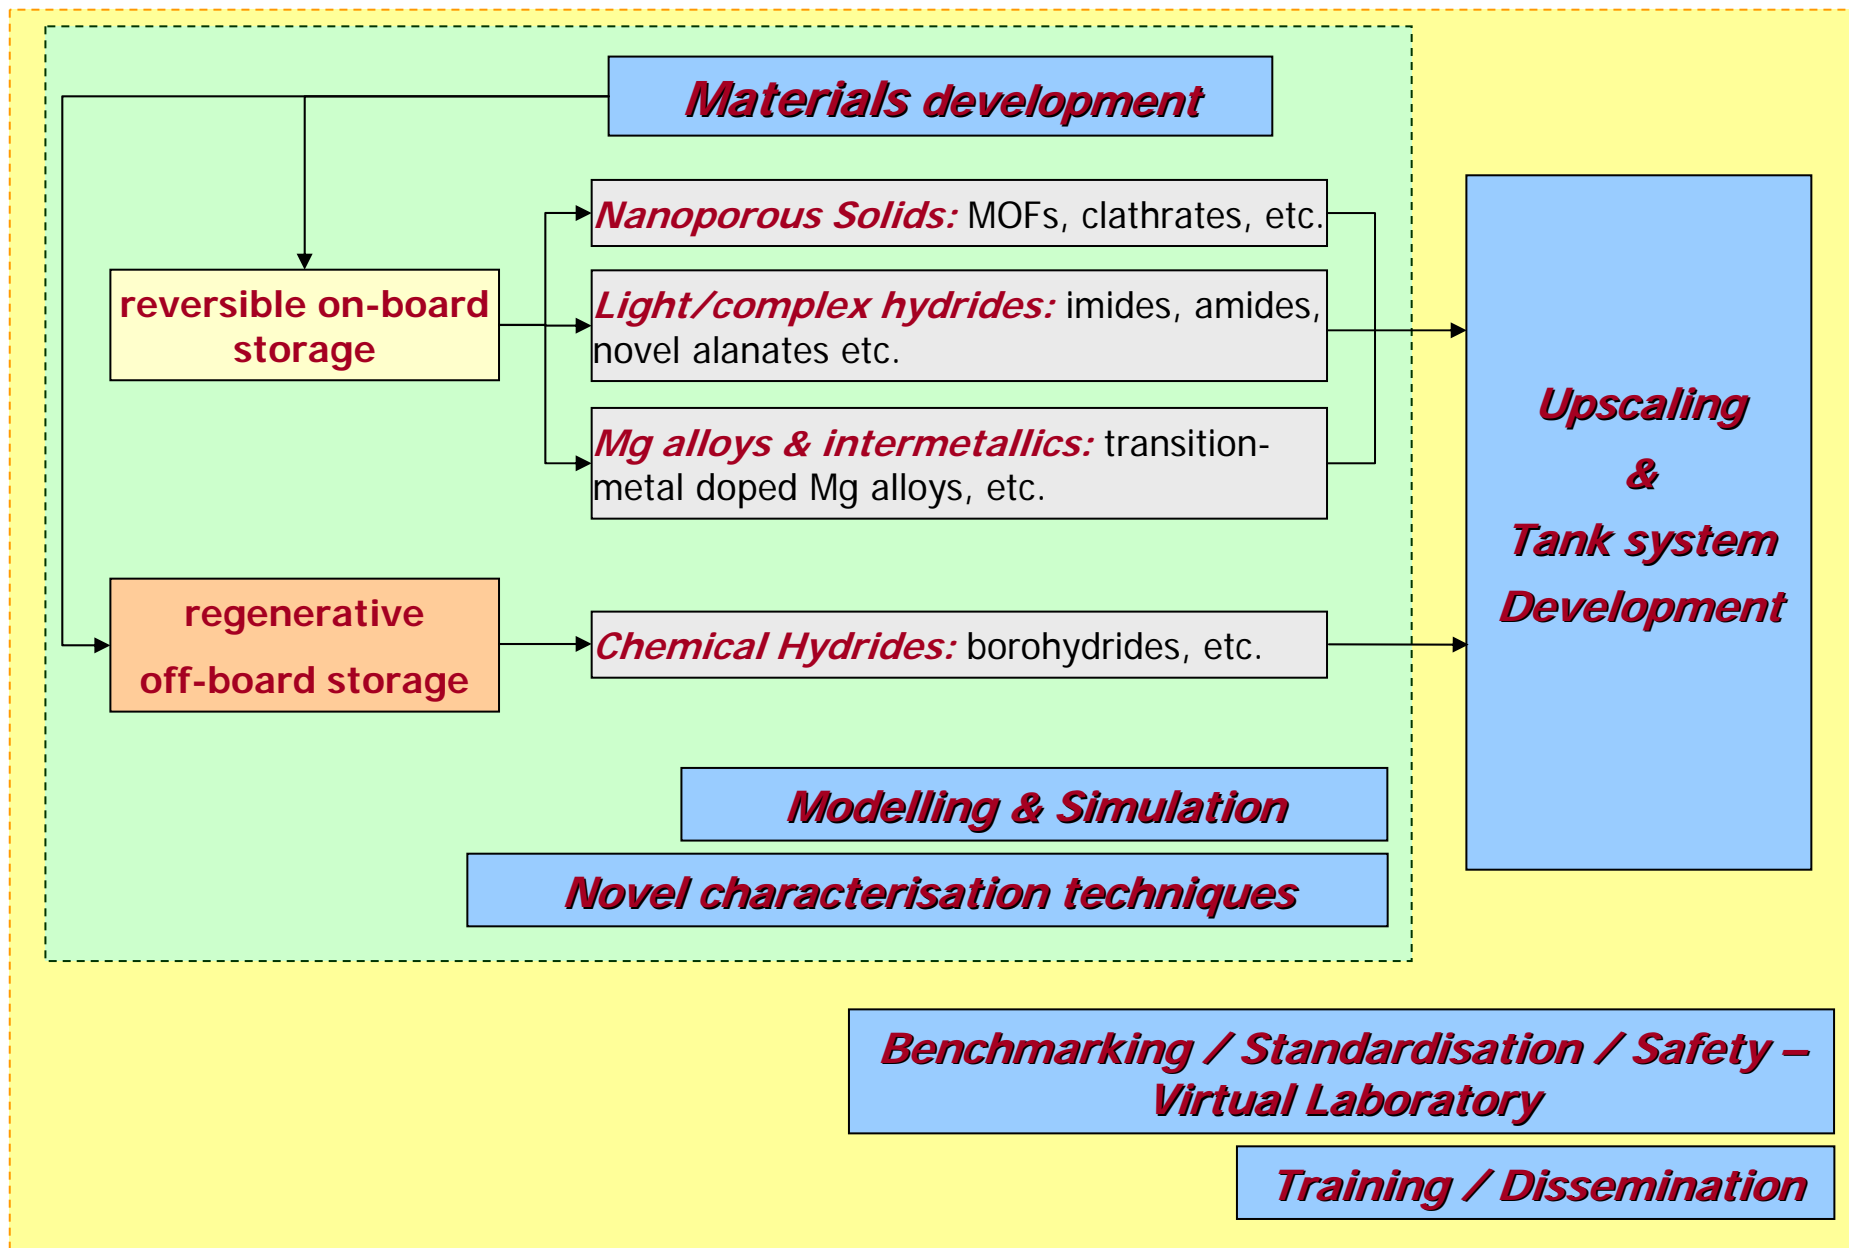

# NESSHY key objectives

.... *NESSHY is a European endeavour aspiring to adopt a holistic multidisciplinary approach, aiming at advancing the current state of hydrogen storage in solid materials, with respect to .....*

- novel materials
- enhanced understanding of the physical mechanisms involved
- novel analytical characterisation tools and measurement techniques
- standardisation, testing protocols
- ab initio and phenomenological modelling using advanced numerical methods for optimal storage design
- upscaling the production processes of promising materials
- design and testing of storage tank systems

# Overall approach

# NESSHY

## Major Achievements

# Porous Solids

## Framework materials

- Assessment of H<sub>2</sub> storage capacity on a range of MOF materials (from BASF)
  - 5 wt% H<sub>2</sub> (77 K, 60 bar)
- Investigation of the effect of pore size/metal centers on H<sub>2</sub> sorption

**Cu-BTC**

Picture from Krawiec et al. *Adv. Eng. Mater.* **8** (2006) 293

**MOF-5**

Picture kindly provided by J. Rowsell

**MIL-53**

- New MOF structures (e.g. Zn-based Sulfone Functionalized MOFs )

**UoC-1**

**UoC-2**

**4,4'-biphenyl-2,2'-disulfone (ligand)**

# Metal doping

Improvement of MOFs H<sub>2</sub> storage capacity by functionalizing the organic linker with Li

E. Klontzas, A. Mavrandonakis, E. Tylianakis, G. E. Froudakis, *Nano Letters*, 8 (2008) 1572

## Improving the Hydrogen-Adsorption Properties of a Hydroxy-Modified MIL-53(Al) Structural Analogue by Lithium Doping\*\*

Angewandte  
Chemie

### Communications

#### Metal–Organic Frameworks

D. Himsl, D. Wallacher,  
M. Hartmann\*

Improving the Hydrogen-Adsorption Properties of a Hydroxy-Modified MIL-53(Al) Structural Analogue by Lithium Doping

Lithium makes the difference: A simple strategy for the synthesis of lithium-doped porous metal–organic frameworks (MOFs) is developed (see structure C black, O red, AlO<sub>6</sub> blue octahedra) thus, paving the way for the facile preparation of lithium-doped MOFs. Moreover, the significant increase in hydrogen adsorption predicted by theoretical calculations is observed.

# Nanoporous materials

## Enhanced H<sub>2</sub>/porous solid interaction via metal doping

- Synthesis of novel carbogenic foam with high surface spin concentration

Sodium Chloranilate Dihydrate

Calcination  
300 °C

C<sub>2</sub>OH

d ~ 0.030 g cm<sup>-3</sup>  
500 m<sup>2</sup> g<sup>-1</sup>  
67 % porosity

Synthesis of metal/carbon foam nanocomposites

to exploit the “**spillover effect**” →

Pd: 2.1 wt% H<sub>2</sub> uptake at 300 K, 3 bar ; Mixed

metals: 2.5 - 5 wt% at 300 K, 80 bar

# The spillover mechanism

## Theoretical evidence

"Spillover" is favourable in carbon materials with oxygen functional groups

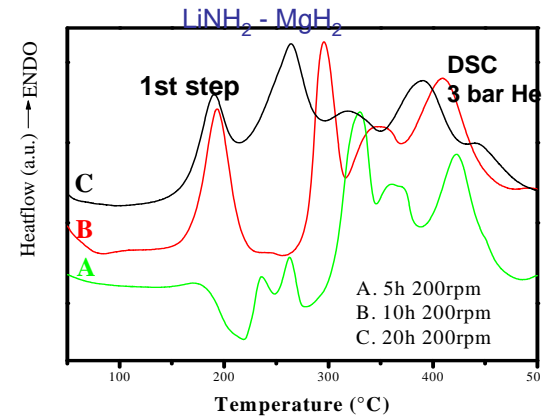

- Barrierless dissociation of H<sub>2</sub> molecules on Pt (or Pd) cluster
- H – migration to graphite oxide: energy barrier = 9.2 kcal/mol (vs. 60 Kcal/mol in graphene)
- Diffusion of chemisorbed H requires ~ 7.6 kcal/mol (vs. 31 kcal/mol in graphene)
- H<sub>2</sub>O formation also probable (energy barrier = 9.5 kcal/mol)

# Light/Complex Hydrides

## Amides/imides systems

- Mg- and Li-amides and imides structure determination
- Produced Mg-Li-NH systems in Mg by ball milling :  
Li ratios 1:2, 3:8 and 1:1
- 3Mg – 8LiNH<sub>2</sub> system reversible at 200 °C/100 bar H<sub>2</sub>. For 1:1 system: need >300°C for desorption, practically reversible
- Improved understanding of the reaction mechanisms for 1:2 & 3:8 systems (FZK, IFE)
  - Reaction mechanism mediated by ammonia (FZK)
  - Intermediate phase for the 3:8 system: Li<sub>2.6</sub>MgN<sub>2</sub>D<sub>1.4</sub> (IFE)
- 1:1 system: 6-6.5wt% (225°C), possible candidate for small tank (FZK, collaboration with Univ. Utah)

# Light/Complex Hydrides

## Borohydrides

- Synthesis of Mg(BH<sub>4</sub>)<sub>2</sub>, Ca(BH<sub>4</sub>)<sub>2</sub>, LiBH<sub>4</sub> by different methods – Structural & decomposition investigations (incl. determination of intermediate phases)

CaB<sub>2</sub>H<sub>2</sub>

## Mixed alanates

- Changed thermodynamics by substitution with fluorine in NaAlH<sub>4</sub> → launch of FP7 project FLYHY

# Virtual Laboratory

- **Organisation of the first Round Robin Test in Europe:**
  - Physisorption @ 77K (commercial Carbon Molecular Sieve) – Completed
  - Complex hydride (already started) & Mg-based materials (starting soon)
  - In collaboration with SwRI/DoE and external (EU & non EU) organisations
- **Accuracy and source of errors of hydrogen capacity measurements report\***

\*D.P. Broom, "The accuracy of hydrogen sorption measurements on potential storage materials", *International Journal of Hydrogen Energy*, **32** (2007) 4871– 4888)

# An Integration paradigm

**Solid hydrogen storage based on  $\text{MgH}_2$  :  
from nano-structured powders to pilot  
tank development**

# Mg Alloys and Intermetallics (film vs bulk)

## Mg<sub>7</sub>TMH<sub>~14</sub>

- Reversibility - understanding why both film and bulk hydrides can be cycled reversibly (stop the TM-H building blocks from dehydrating and dehydrate the Mg-H part)
- DFT calculations indicate stable Mg<sub>3</sub>TM tetrahedral sites in bulk hydrides. If they are not fully emptied, the FCC structure is maintained, and the hydrides are reversible. In film hydrides, dispersed TiH<sub>2</sub> clusters, with a size smaller than 20 nm, keep the structure from collapsing during cycling. Strong TM-H bonds form building blocks responsible for preventing the more open FCC structure from collapsing into more stable hydrides. Both systems show significantly more rapid diffusion than rutile MgH<sub>2</sub>.

Bulk Mg<sub>7</sub>TMH<sub>~14</sub>

Cluster size < 20 nm in film Mg<sub>7</sub>TMH<sub>~14</sub>

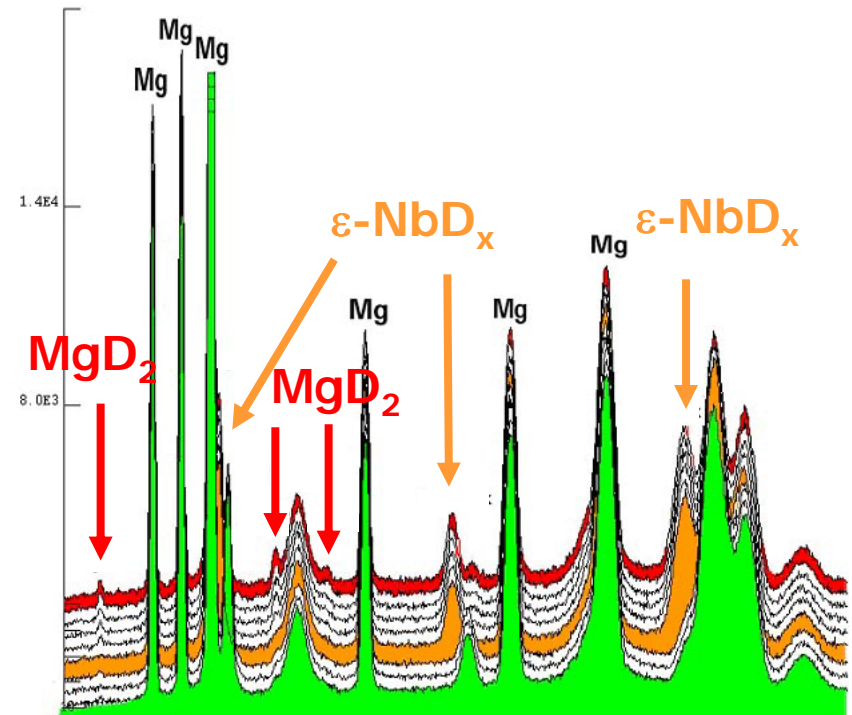

# Ball-milling from MgH<sub>2</sub>

- Optimization of the Ball-milling process
- Impact of transition element additions

## In-situ neutron diffraction study (ILL - D20)

**$\epsilon$  - NbD<sub>0.75</sub> rapid formation  
prior to the MgD<sub>2</sub> formation**

**Initiating role of the transition  
metal** Additives = "gates" that favour  
the hydrogen dissociation,  
then the hydrogen diffusion

In-situ hydrogenation  
(5 at.% Nb, T ~ 280 ° C, P = 20 bars)

# Alternative route for Mg processing: ECAP

- Production of nanostructured Mg at lower cost
- Enhanced sorption kinetics

# MgH<sub>2</sub> + ENG compacts

Compaction of MgH<sub>2</sub> +  
Expanded Natural Graphite

## The benefits of composite material:

- Solid and fully machinable
- High thermal conductivity  
(x 30 vs. ball-milled powders)
- Safe and inert in air
- Density of MgH<sub>2</sub> x3

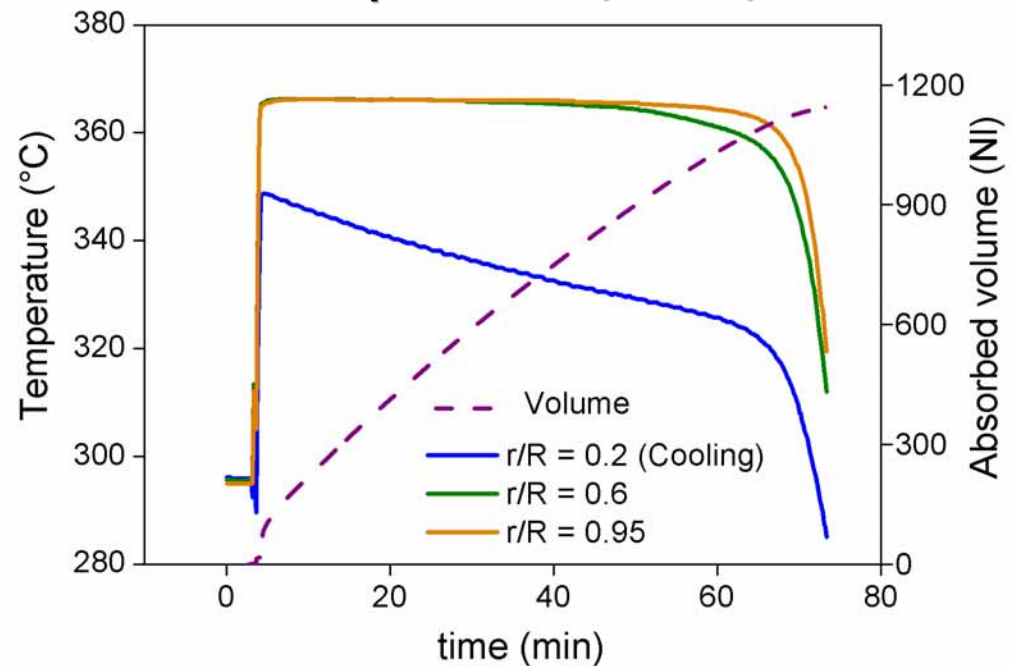

**CNRS patents:**  
**WO2009080986**  
**WO2009080975**

# Intermediate scale tank (1.8 kg MgH<sub>2</sub>)

1170 NL H<sub>2</sub> - 104.5 gr H<sub>2</sub> (6,07 wt %)

## Absorption test (10 bar)

**System capacities :**  
42 g/l - 0.85 wt %

**Connection to a Fuel Cell\***

2kW<sub>e</sub> for 45 min

\* designed by CEA – Grenoble

**Auto-adaptive system :**

No need to adapt hydrogen pressure or mass flow

# Up-scaling of the production

- Ball milling of MgH<sub>2</sub>
- Specific additives (Ti-Cr-V), CNRS patent WO 2007125253
- Compaction with ENG
- Large scale tanks design & manufacture (10-20 kg MgH<sub>2</sub>)

## Stationary applications

- Storage of sustainable energy forms
  - Balancing energy peaks

## Low to medium temperature pilot scale tank

- design and build a complex hydride tank with improved characteristics with respect to the sodium alanate STORHY tank (0.865 wt %, 21 kg H<sub>2</sub>/m<sup>3</sup>)

# Integration, Training, Dissemination

- [www.nesshy.net](http://www.nesshy.net)
- Interaction with other hydrogen related projects (IP-STORHY, PICS, COSY, HYDROGEN RTNs, SURMOF, MOFCAT, HYCONES, NANOHY, FLYHY) – Joint workshops
- Three training and dissemination events with wide multi-national participation have been supported up to now by NESSHY
  - Hydrogen Summer School, University of Iceland - Reykjavik (June 2006, June 2008)
  - Magnesium Titanium Hydride workshop, Vrije Universiteit - Amsterdam (August 10, 2006)
- NESSHY Newsletters
- Establishment of collaboration with Chinese and Russian organisations → SSA **HYSIC** (also participation to Round Robin Test)
- More than 340 publications/presentations in journals/conferences
- 8 patent applications

# Enhancing Cooperation

## Collaboration with other FP6 & FP7 projects

	Project	Coordinator	Topic
Energy Priority	<b>STORHY</b> <a href="http://www.storhy.net">www.storhy.net</a> 2004-2008	<b>Magna Steyr</b> <i>Austria</i>	Next generation H <sub>2</sub> storage technologies (compressed gas, cryogenic liquid and solid materials*) with a focus on automotive applications * Na-alanate, mixed alanates, alane
	<b>NANOHY</b> <a href="http://www.nanohy.eu">www.nanohy.eu</a> 2008-2011	<b>Forschungszentrum Karlsruhe</b> <i>Germany</i>	Nanocomposites consisting of hydride particle sizes in the lower nm range protected by a nanocarbon template or by self-assembled polymer layers in order to prevent agglomeration
	<b>FLYHY</b> <a href="http://www.flyhy.eu">www.flyhy.eu</a> 2009-2011	<b>GKSS Research Centre Geesthacht GmbH</b> <i>Germany</i>	Materials destabilisation / stabilisation by halogen substitution for alane, borohydrides and reactive hydride composites, in order to achieve a breakthrough in the thermodynamic properties of these materials
NMP Priority	<b>HYCONES</b> <a href="http://www.hycones.eu">www.hycones.eu</a> 2006-2009	<b>NCSR Demokritos</b> <i>Greece</i>	Hydrogen storage in carbon cones
	<b>SURMOF</b> <a href="http://www.rhur-uni-bochum.de/pc1/SURMOF">www.rhur-uni-bochum.de/pc1/SURMOF</a> 2006-2009	<b>Rhur University</b> <i>Austria</i>	Anchoring of MOFs to surfaces
	<b>MOFCAT</b> <a href="http://www.sintef.no">www.sintef.no</a> 2006-2011	<b>SINTEF</b> <i>Norway</i>	Functional MOFs as heterogeneous catalysts and adsorbents

	<b>HYDROGEN</b> <a href="http://www.theorchem.leidenuniv.nl">www.theorchem.leidenuniv.nl</a> 2006-2009	<b>Leiden University</b> <i>The Netherlands</i>	Hydrogen storage in alanates, borohydrides and a new class of materials to store it in form of ammonia

**Workshop on  
Solid Storage of Hydrogen - International  
Perspectives**  
co-organized by **NESSHY, HYCONES, and NANOHY  
EC projects**  
Fodele Beach Hotel – Crete, Greece  
10 - 11 June 2009

**Wednesday, June 10**

09:15-09:30	Welcome - Introduction	NESSHY, HYCONES, NANOHY Coordinators
09:30-10:00	Novel Efficient Solid Storage for Hydrogen – the NESSHY Project	Thanos Stubos NCSR "Demokritos"
10:00-10:30	Hydrogen Storage in Carbon Cones – the HYCONES Project	Theodore Steriotis NCSR "Demokritos"
10:30-11:00	Embedding Hydrides in Nanoscale Matrices – the NANOHY Project	Max Fichtner FZK
11:00-11:15	<i>Coffee break</i>	
11:15-11:45	Metal-Organic Frameworks for Hydrogen Storage	Jeffrey Long U. Berkeley
11:45-12:15	SW Carbon Nanohorns for Hydrogen Storage	David Geohagan ORNL
12:15-12:45	On Nanoscaffolding and Nanostructures Impact on Metal Hydride Materials Performance: On-going Efforts in USA	Ewa Rönnebro PNNL
12:45-14:00	<i>Lunch break</i>	
14:00-14:30	Developments on Nanostructured Materials / Carbons	Gavin Walker U. Nottingham
14:30-15:00	Novel Functionalized Metal-Organic Frameworks and High Surface Area Carbon-based Materials for Hydrogen Storage	Pantelis Trikalitis U. Crete
15:00-15:30	Complex Hydrides for Hydrogen Storage	Max Fichtner FZK
15:30-16:00	Borohydrides for Hydrogen Storage	Andreas Züttel EMPA
16:00-16:20	<i>Coffee break</i>	
16:20-16:50	Improving Hydrogen Storage Properties of Mg-based Hydrides by Limiting Metal Atom Diffusion	Dag Noreus U. Stockholm
16:50-17:20	Tanks for Complex Hydrides	Jose Bellosta von Colbe GKSS
17:20-17:40	JTI Prospects/Opportunities for Hydrogen Storage	Marcello Baricco U. Torino
17:40-18:00	Discussion – Closing of Day I	ALL
18:00 -19:00	Poster session	

**Thursday, June 11**

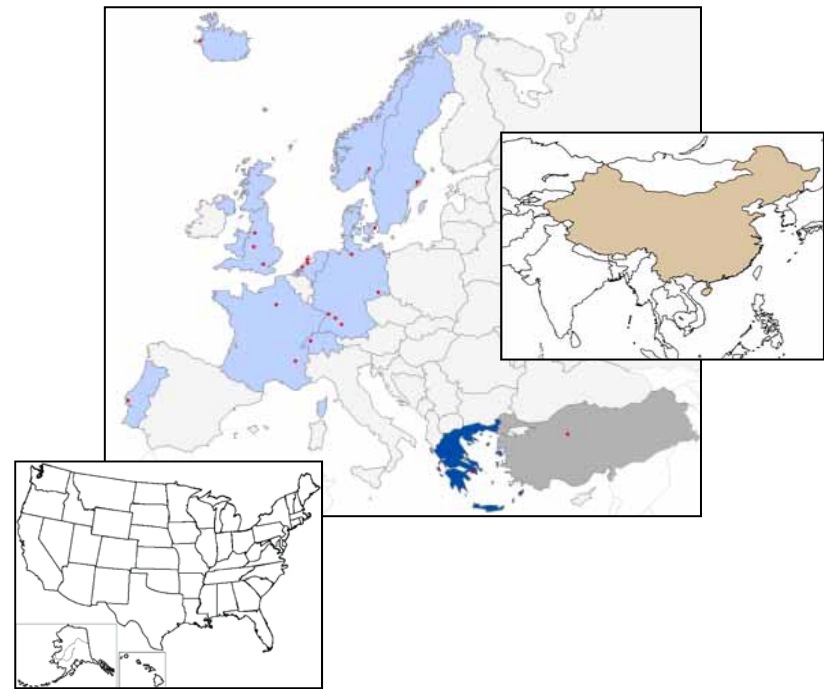

09:30-10:00	From Optimised MgH <sub>2</sub> based Composites to Efficient Storage Tanks	Patricia de Rango CNRS
10:00-10:30	Design of Nanoporous Materials for Hydrogen Storage	George Froudakis U. Crete
10:30-11:00	Computer Modelling of Release Temperature in Hydrogen Storage Materials	Ian Morisson U. Salford
11:00-11:20	<i>Coffee break</i>	
11:20-11:50	Hydrogen Storage: Car Industry Perspective	Katsuhiko Hirose Toyota
11:50-12:10	IEA – HIA Task 22 Activities	Bjom Hauback IFE
12:10-13:00	Discussion - Closing Remarks	ALL
13:00	End of Workshop	

# Enhancing Cooperation

## International Collaborations

- **IPHE** label (September 2006)
- Participation of **SwRI**, the American institute officially appointed by DoE for standardisation in H<sub>2</sub> solid storage measurements
- **HySIC**: “Enhancing International Cooperation in running FP6 Hydrogen Solid Storage Activities”  
Specific Support Action linked to NESSHy (2007-2008)
  - 8 partners from EU, Russian Federation, P. R. China
  - Key Objectives:
    - *Performance of studies enhancing international cooperation (sample preparation and characterisation, benchmarking, round-robin testing, testing protocol standardization)*
    - *Joint dissemination actions (workshops and integration activities)*

# The HySIC SSA Experience

- Staff exchanges for training and R&D
  - Sample synthesis and exchanges
- Participation to NESSHY Round Robin Tests
  - Joint publications
  - Joint experimental campaigns :  
(USAL/Nankai: Neutron Scattering on Mg-nanowires)
- Joint HySIC-NESSHY dissemination actions in China

## Workshop September 2008

- Wide participation of Chinese groups
- Visits to GRINM, LN-Power Sources Co.
- Opportunities for further collaboration

NESSHY  
Novel Efficient Solid Storage for H<sub>2</sub>

The NESSHY Team
